Subject: GenFlex Response to MRCA T & R Committee Advisory on TPO

In February 2010, the Midwest Roofing Contractors Association's Technical and Research Committee issued an advisory on TPO roofing membranes indicating that high solar loading and elevated temperatures may lead to the breakdown of the membrane in affected areas. To date, GenFlex has received no information from MRCA or the market that GenFlex TPO was the topic of this article.

GenFlex TPO membranes have performed consistently throughout the years, with no known deterioration due to high solar loading and elevated temperatures. The ingredients used in GenFlex TPO, such as antioxidants, UV absorbers, light stabilizers, heat stabilizer, etc., have been carefully selected and tested to ensure the longevity of the product and roofing system. At this time, GenFlex has no immediate plans to implement any changes to its TPO formulation.

GenFlex has a long history of delivering high-quality roofing membranes, and we continue to stand behind our products. We appreciate your continued support and trust in our company.

Thank you for your continued support of GenFlex.

Sincerely,

Marty Jolly
National Sales & Marketing Manager
