

Unroll the GenFlex Peel & Stick™ membrane 20' to 30' and align as required ensuring the selvage edge of the panel is downslope to facilitate proper seam lapping (shingle lapping) in the direction of water flow. Care is required in order to ensure proper alignment of the membrane panel.

Back roll the laid out membrane 10' to 15'. The 15' to 20' of membrane left rolled out at this point is intended to keep the panel aligned. Care should be taken to avoid shifting the panel during back rolling.

Carefully cut the release liner across the back rolled membrane as shown in the detail - **DO NOT CUT THE ROOFING MEMBRANE**. If a cut in the membrane does occur a proper repair to the membrane surface will be required following installation. After the release liner is cut, peel the edge of the release liner along the cut and proceed to pull the release liner from the adhesive film on the membrane.

This action will also pull the membrane along the installation path as the release liner is peeled from the adhesive film. Once the roll is fully applied use a stiff bristle broom and positive downward pressure to broom in the newly applied Peel & Stick™ membrane. Brooming direction should be across the short axis of the membrane panel to avoid creating wrinkles in the sheet.

Once the newly installed membrane is broomed into place back roll the remaining membrane to the edge of the cut release liner. Peel the release liner from the adhesive film which in turn will pull the roll in the installation direction mating the adhesive film of the Peel & Stick™ panel to the roof substrate. Care should be taken to avoid shifting the roll during installation to prevent wrinkles in the membrane panel. After the membrane has been fully applied use a stiff bristle broom and positive downward pressure to broom in the newly applied Peel & Stick™ membrane. Brooming direction should be across the short axis of the membrane panel to avoid creating wrinkles in the sheet.
